- Cash drawer opening event triggers event log for video retrieving.

Applications
- Convenience Stores
- Retail Stores
- Fast Food Restaurants
- Gas Stations
- Grocery Stores
- Parking Lot Toll Booths...

POS-DVR Point of Sale System
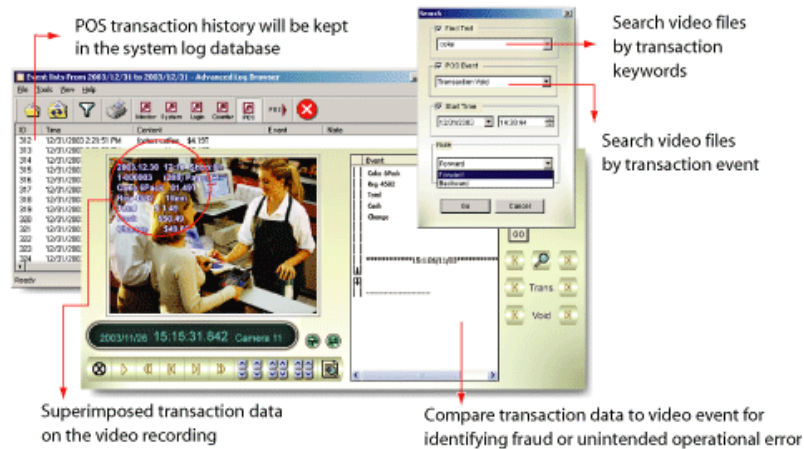

Introduction

Loss prevention in retail business is concerned with minimizing inventory shrink and currency shorts. Losses related to POS transactions can be a main cause of the shrinkage. An effective POS-DVR surveillance solution can help your operation minimize these problems.

POS transaction history will be kept in the system log database

Search video files by transaction keywords

Search video files by transaction event

Superimposed transaction data on the video recording

Compare transaction data to video event for identifying fraud or unintended operational error

Main-Features

- **POS Video Text Overlay:** Transaction text messages are displayed on live and recorded video.

- **Quick Search:** A quick-search of your transaction history provides all events that match your criteria along with the video of each transaction.

- **Advanced Search:** Allows the user to access Advanced Log Browser to search for all the transaction lists within a specific time frame and on pre-defined criteria.

- **POS Field Filter:** Allows the user to use a search filter that results in displaying a user-defined transaction. For example, all the transactions containing the keyword "coke" will be displayed.

- **Abnormal Transaction Alerts:** When pre-defined abnormal transactions occur, such as transactions over a certain value amount, the system will automatically output alarm devices and activate an alert message via email, phone, or by SMS

- **Recording:** Video and audio recording capable. Recording can be automatically activated when transaction starts.

- **Live Remote Audio and Video Monitoring:** Store owners can monitor live audio/video or search recorded history from the comfort of their home or remote office.

- **Superimposing POS data:** POS transaction data, camera name and time are displayed on screen and on recorded video files. User can select screen location and font colors.

- **Transaction Database:** All POS transaction data will be stored in Microsoft Access format database, capable of retroactive analysis.

- **Smart Search:** Allows the user to pre-define a case-sensitive search area to pin point any suspicious shoplifter.
